

Assembling Syntax: Modeling Constituent Questions in a Grammar Engineering Framework

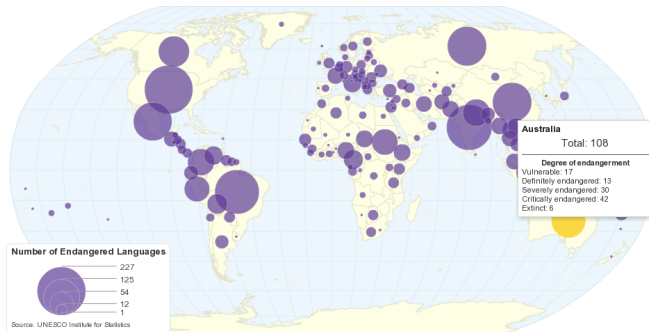

Olga Zamaraeva

Department of Linguistics, University of Washington
SigTyp Lecture Series

May 14 2021

Range of language variation

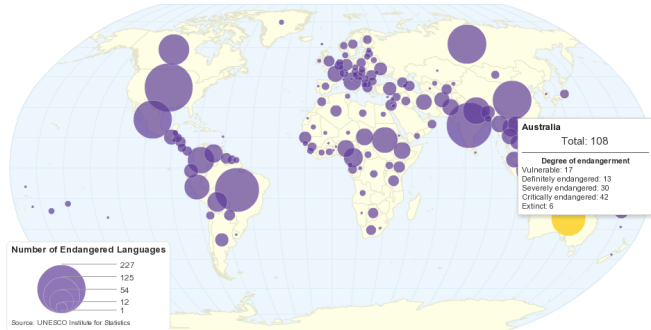

- ▶ There are over 7000 languages in the world¹ 🌐
- ▶ 90% of people speak about 10% of them
 - ▶ Many languages are being spoken less and less and may disappear

<http://chartsbin.com/view/1339>

Understanding the range of language variation is important:

- ▶ For culture and society
- ▶ For science
 - ▶ One of the **fundamental goals of linguistics**
 - ▶ What about natural language processing?

<http://chartsbin.com/view/1339>

 - ▶ Naturally care: Finding/describing/analyzing range of variation is a fundamental goal
- ▶ NLP:
 - ▶ For learning about language faculties:
 - ▶ Probably care, similar to like linguists do
 - ▶ For performing tasks:
 - ▶ Maybe we care, but not if we can successfully transfer models from a few high-resource languages?

Does NLP care about range of language variation?

- ▶ Linguists:
 - ▶ Naturally care: Finding/describing/analyzing range of variation is a fundamental goal
- ▶ NLP:
 - ▶ For learning about language faculties:
 - ▶ Probably care, similar to like linguists do
 - ▶ For performing tasks:
 - ▶ Maybe we care, but not if we can successfully transfer models from a few high-resource languages?
 - ▶ Sure, but how do we **evaluate** the performance?

Understanding the range of language variation is important:

- ▶ For culture and society
- ▶ For science
 - ▶ One of the **fundamental goals of linguistics**
 - ▶ Core to evaluating NLP models
 - ▶ Can transfer a model from English to another language but still need systematic knowledge about that other language to evaluate

- ▶ **Goal:** Make implemented linguistic grammars bigger and more accessible to broader research community
- ▶ **Method:** Meta-grammar engineering with Head-Driven Phrase Structure Grammar
- ▶ **Project:** Analysis of constituent questions for a grammar engineering system
- ▶ **Result:**
 - ▶ New library in the system; more complex hypotheses can be tested
 - ▶ Archived test suites and analyses for several languages
 - ▶ Some takeaways regarding the interaction of different analyses

- ▶ **Fully explicit** formalism⁶
- ▶ Lexicalist and surface-oriented
- ▶ A grammar is a hierarchy of **types** encoded as **feature structures** where features are constrained to have some values
- ▶ A structure licensing a sentence must be **well-formed**

<i>subj-head-phrase</i>	
SUBJ	$\langle \rangle$
HEAD-DTR	$\boxed{2} [\text{SUBJ} \ \langle \boxed{1} \rangle]$
NON-HEAD-DTR	$\boxed{1}$
ARGS	$\langle \boxed{1}, \boxed{2} \rangle$

- ▶ Describes a feature structure that is a phrase and can be visualized as a tree
- ▶ “Mother” and “daughter” nodes
- ▶ Identities (tags)

<i>subj-head-phrase</i>	
SUBJ	$\langle \rangle$
HEAD-DTR	$[2 \text{ [SUBJ } \langle 1 \rangle]]$
NON-HEAD-DTR	$[1]$
ARGS	$\langle [1], [2] \rangle$

- ▶ Both types of research exist
- ▶ HPSG formalism can be used to posit multiple theories
- ▶ DELPH-IN HPSG 🐙
 - ▶ International research consortium⁷
 - ▶ Restricted version of HPSG formalism

- ▶ The English Resource Grammar (ERG) ⁸
 - ▶ **Broad** coverage; used in NLP⁹
 - ▶ Semantic representations (ERS, MRS, DMRS) used widely for **evaluating semantic parsers**¹⁰

Hajdik et al. 2019; Zamaraeva, Howell, and Rhine 2018; Buys and Blunsom 2017; Packard 2014

10

Oepen and Flickinger 2019

-
- Figure 1 illustrates a dependency parse tree for the sentence "The person who lives in the house of the generic entity that is the queen of Denmark is the queen of Denmark." The tree shows hierarchical groupings of words into phrases. For example, "person who lives in the house of the generic entity" is a single phrase, and "that is the queen of Denmark" is another. Arrows indicate grammatical relations: ARG1, ARG2, and RSTR.

Choices regarding the position of question phrases

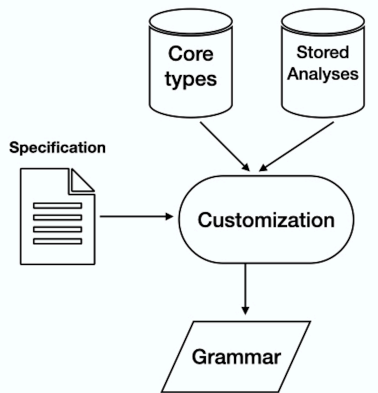

Question phrases can appear at the left edge of the sentence regardless of the position the questioned constituent would appear in (*Who did you see? I know who you saw* etc.):

- ☐ Only one question phrase can be fronted
- ☒ All question phrases can be fronted
- ☐ Question phrases cannot be fronted (stay *in situ*)

The Grammar Matrix

- ▶ Meta-grammar engineering framework¹⁹
- ▶ Input: Typological specification, lexicon, morphological rules
- ▶ Output: Implemented HPSG grammar fragment
 - ▶ Parse and generate sentences
 - ▶ Output syntactic and **semantic** representations
- ▶ Many syntactic phenomena are supported²⁰

¹⁹ <https://matrix.ling.washington.edu/customize/matrix.cgi>

²⁰ Zamaraeva 2021; Zamaraeva, Howell, and Bender 2019; Howell and Zamaraeva 2018; Saleem 2010; Song 2014; Nielsen 2018; Drellishak and Bender 2005; Crowgey 2013; Bender and Flickinger 2005

- ▶ Specify several phenomena at the same time
- ▶ Click to **get a grammar fragment** covering all of them²¹
- ▶ Test hypotheses **in interaction**
- ▶ Parse and **generate** data within fragment's area of coverage
 - ▶ Large lexicons can be imported

(4) Gde kto chto vidit?
where who.NOM what.ACC see.3SG
'Who sees what where?'[rus]

RQ: *What constitutes a model of a range of typologically attested ways of forming constituent questions within the given framework?*

Evaluation: How well does the analysis generalize to a set of randomly picked “held-out” languages?

Constituent questions in the Matrix
