# Information-Theoretic Characterization of Vowel Harmony: 

 A Cross-Linguistic Study on Word ListsJulius Steuer ${ }^{1}$,Badr Abdullah ${ }^{1}$, Johann-Mattis List ${ }^{2}$, Dietrich Klakow ${ }^{1}$<br>${ }^{1}$ Language Science and Technology, Saarland University ${ }^{2}$ MPI-EVA / Univ. of Passau

## SIGTYP @ EACL 2023

## Vowel Harmony

- Constraint on the vowels in a word form
- Vowels need to agree w. r. t. a feature
- Backness (Finnish, Hungarian, Turkish, Korean), Roundness (Turkish, Mongolian), Nasality (Guaraní), Tongue root position (Mongolian)
- Surfaces mainly in inflectional and derivational morphology

## Vowel Harmony

- Constraint on the vowels in a word form
- Vowels need to agree w. r. t. a feature
- Backness (Finnish, Hungarian, Turkish, Korean), Roundness (Turkish, Mongolian), Nasality (Guaraní), Tongue root position (Mongolian)
- Surfaces mainly in inflectional and derivational morphology

Turkish Front, Back harmony:

| Genitive -In | $=[\mathrm{un}] /[\mathrm{un}] /[\mathrm{yn}] /[\mathrm{in}]$ |  |
| :--- | :--- | :--- |
| Plural | -lAr | $=[\mathrm{ler}] /[\mathrm{lar}]$ |

## Vowel Harmony

- Constraint on the vowels in a word form
- Vowels need to agree w. r. t. a feature
- Backness (Finnish, Hungarian, Turkish, Korean), Roundness (Turkish, Mongolian), Nasality (Guaraní), Tongue root position (Mongolian)
- Surfaces mainly in inflectional and derivational morphology

Turkish Front, Back harmony:

| Genitive -In | $=[u n] /[u n] /[y n] /[i n]$ |
| :---: | :---: |
| Plural -1Ar | $=[1 \varepsilon \mathrm{r}] /[\mathrm{lar}]$ |
| [kuz] 'girl' + | enitive) $=$ [kuzum $]$ |
| [jyz] 'face' + | enitive) $=$ [jyzyn] |

## Vowel Harmony

- Constraint on the vowels in a word form
- Vowels need to agree w. r. t. a feature
- Backness (Finnish, Hungarian, Turkish, Korean), Roundness (Turkish, Mongolian), Nasality (Guaraní), Tongue root position (Mongolian)
- Surfaces mainly in inflectional and derivational morphology

Turkish Front, Back harmony:

```
Genitive -In \(=[u n] /[u n] /[y n] /[i n]\)
Plural - \(\mathrm{lAr}=[1 \varepsilon r] /[l a r]\)
[kuz] 'girl' + -In (genitive) \(=\) [kuzun] + -lAr (plural) \(=\) [kuzlarun \(]\)
[jyz] 'face' + -In (genitive) \(=\) [jyzyn] +-1 Ar (plural) \(=\) [jyzl\&rin \(]\)
```

## Motivation

## Previous Work:

- Quantify vowel harmony based on estimates from large corpora of inflected word forms
- E.g. Goldsmith \& Riggle (2012), Baker (2009), Mayer et al. (2010)
- Requires specific and on a specific type of data (precompiled lists of inflected word forms, running text)
- Cannot be applied to low-resource languages

## Motivation

## Previous Work:

- Quantify vowel harmony based on estimates from large corpora of inflected word forms
- E.g. Goldsmith \& Riggle (2012), Baker (2009), Mayer et al. (2010)
- Requires specific and on a specific type of data (precompiled lists of inflected word forms, running text)
- Cannot be applied to low-resource languages

## Our Approach:

- Use concept-based word lists instead of large corpora
- (Recover vowel harmony even if it is no more present in inflectional morphology)
- NLMs are a smart way to parametrize a probability distribution
- Quantify vowel harmony based on the performance of a NLM

## Language Sample

- Subset of NorthEuraLex
- 5 languages with vowel harmony
- 5 languages without vowel harmony
- "Harmonic Groups" defined by features

| Language | Harmonic Groups |  |  |
| :---: | :---: | :---: | :---: |
| Finnish | $\begin{gathered} -\mathrm{BACK} \\ \{\mathrm{y}, \varnothing, æ\} \end{gathered}$ | $\begin{aligned} & \hline+\mathrm{BACK} \\ & \{\mathrm{u}, \mathrm{o}, \mathrm{a}\} \end{aligned}$ | BACK neutral $\{\mathrm{e}, \mathrm{i}\}$ |
| Hungarian | $\begin{aligned} & -\mathrm{BACK} \\ & \{\mathrm{y}, \varnothing\} \end{aligned}$ | $\begin{gathered} +\mathrm{BACK} \\ \{\mathrm{u}, \mathrm{o}, \mathrm{~d}\} \end{gathered}$ | $\begin{gathered} \hline \text { BACK neutral } \\ \{\mathrm{e}, \mathrm{i}\} \end{gathered}$ |
| Manchu | $\begin{gathered} -\mathrm{BACK} \\ \{\mathrm{e} / \gamma\} \end{gathered}$ | $\begin{gathered} +\mathrm{BACK} \\ \{\mathrm{a}, \mathrm{o} \mathrm{\}} \end{gathered}$ | BACK neutral $\{i, u\}$ |
| Khalkha Mongolian | -ATR <br> \{e, u, o\} <br> -ROUND <br> \{e, a, i\} | $\begin{gathered} + \text { ATR } \\ \{\mathrm{a}, \mathrm{U}, \mathrm{o}\} \\ + \text { ROUND } \\ \{\mathrm{oo}\} \end{gathered}$ | ATR neutral <br> \{i\} <br> ROUND neutral $\{\mathrm{u}, \mathrm{u}\}$ |
| Turkish | $\begin{gathered} -\mathrm{BACK} \\ \{\mathrm{i}, \mathrm{e}, \mathrm{y}, \infty\} \\ - \text { ROUND } \\ \{\mathrm{i}, \mathrm{e}, \mathrm{u}, \mathrm{o}\} \end{gathered}$ | $\begin{gathered} \text { +BACK } \\ \{\mathrm{w}, \mathrm{a}, \mathrm{u}, \mathrm{o}\} \\ +\mathrm{ROUND} \\ \{\mathrm{w}, \mathrm{a}, \mathrm{y}, \infty\} \end{gathered}$ | BACK neutral ROUND neutral |
| Arabic |  |  |  |
| Ainu |  |  |  |
| Estonian |  |  |  |
| Armenian |  |  |  |
| Basque |  |  |  |

## Methodology

## Feature Surprisal from Word Lists

- Average feature surprisal over vowel positions $t$ for harmonic group $H$ in word list $W$ :

$$
\bar{\eta}(\mathcal{H})=-\frac{1}{|\mathcal{W}|} \sum_{w \in \mathcal{W}} \sum_{t \in\{\tau, \cdots, T\}} \eta(\mathcal{H}, t)
$$

- Analogical for disharmonic vowels
- Relative strength of vowel harmony is indicated by the difference in average feature surprisal:

$$
\Delta_{\eta}=\bar{\eta}(\mathcal{H})-\bar{\eta}(\neg \mathcal{H})
$$

- Difference quantifies the relative strength of the vowel harmony constraint
- Diff > 0: strong vowel harmony constraint
- Diff $\approx 0$ : no vowel harmony
- Diff < 0: should not occur

## Example

## Phoneme surprisal

- Finnish silmässä [silmæs:æ] 'eye (locative)'
- [i] triggers -BACK harmony
- First vowel [i] is ignored (no context)
- Surprisal at [æ]: $-\log (0.27)=1.8889$

## Feature surprisal

- Surprisal @ -BACK: $-\log (0.66)=0.5995$
- Surprisal @ + BACK: - $\log (0.07)=3.8365$
- Surprisal reduction: 3.8365-0.5995 $=3.2370$

$$
\eta(\mathcal{H}, t)=-\log _{2} \sum_{\pi \in H} p(\pi \mid t, \varphi<t)
$$

- Surprisal of harmonic group $H$ given context

## Neural Language Model

- Probabilities are parametrized via a NLM
- Based on Feedforward LSTM and hyperparameters in Pimentel et al. (2021)
- Task: Next phoneme prediction, minimize NLL loss
- Output restricted to vowel inventory (consonants replaced by mask symbol)
- Separate model trained for each language

## Results

## Turkish

- Turkish has strong BACK and ROUND harmony
-     + BACK harmony stronger than -BACK
- ROUND harmony not as strong as BACK
- Expected, since some suffixes lack + ROUND forms

## Surprisal Reduction

- Difference between surprisal in the harmonic and disharmonic context
- Turkish + Manchu as expected, Finnish \& Hungarian closer to non-VH languages
- Khalkha Mongolian indecisive

## Discussion

SFB 1102

## Findings

- NLM could learn vowel harmony constraints from word list data
- Word lists were on the "larger" side
- Found vowel harmony constraints in
- Turkish, Manchu, Khalkha Mongolian
- To a lesser degree in Finnish and Hungarian
- Few items with $>=3$ vowels for Hungarian
- Makes it difficult to analyze behavior of neutral vowels
- Even fewer for Khalkha Mongolian

## Limits of Word List Data

- Test set of $\sim 300$ word forms
- Majority of the data needed for NLM training
- For complex interactions more data is needed to observe them in the test set
- Neutral vowels, weaker constraints, loanwords, opaque vowels...
- Supports Dockum et al. (2019)
